Datawatch
VisitorWatch

VisitorWatch is a full-featured Visitor Management system that enables tenants, property managers and and security personnel to identify and track visitors.

- Authorized employees can pre-register visitors—from Datawatch's web-based software—assuring proactive access control. Employees or guards can register unscheduled visitors. Registration details include visitor and tenant names, valid day and time ranges, and optional authorized area, assigned turnstile and special instructions.

- Early visitors can be processed before scheduled arrival time, within a user-defined time range.

- Scan a visitor's ID and print a badge in seconds.

- Badges can be optionally limited to specific turnstiles or badge readers—on a per-visitor basis—to support closer tracking and enable additional security checks. Badges automatically expire at a designated date and time.

- Separate lists identify designated fire wardens and show which ones are currently in the building—useful during Fire Marshall inspections and emergency drills.

- Blacklist enables tenants and property managers to list people not authorized to enter a building. System notifies guard if a blacklisted person attempts to obtain a badge.

- View records for scheduled visitors, processed visitors, building fire wardens and blacklisted individuals. Search turnstile/badge reader history to check entry dates and times by visitor or tenant name. Tenants can remotely view visitor records.

- Design custom badge templates for buildings and tenants. Badges can include visitor photo and name, tenant name, bar code, valid date and time, and related data, as well as custom text and graphics.

- VisitorWatch software supports a driver's license reader or license/passport scanner, digitial camera and badge printer. VisitorWatch is fully integrated with Datawatch Access Control to form a comprehensive building security system.
